Then $O \in G$. (poobably reject) $\lambda \approx 1 \Rightarrow \text{as likely that } O \in G$ as $O \in G$. If $\widehat{O} \in G$ then $\lambda = 1$	O = N = I
Then $O \in G_o$ $(pobably reject)$ $\lambda \approx 1 \Rightarrow as likely that O \in G_o as O \in G_o If \widehat{O} \in G_o then \lambda = 1$	1 ≈ 0 ⇒ much more likely 0 € C2
$ \lambda \approx 1 \Rightarrow \text{as likely that } \theta \in \mathcal{C}_0 \text{ as } \theta \in \mathcal{C}_0 $ If $\hat{\theta} \in \mathcal{C}_0$ then $\lambda = 1$	Then $O \in G$
$ \lambda \approx 1 \Rightarrow \text{as likely that } \theta \in \mathcal{C}_0 \text{ as } \theta \in \mathcal{C}_0 $ If $\hat{\theta} \in \mathcal{C}_0$ then $\lambda = 1$	(probably reject)
Idea: reject of I is small enagh	If $\hat{\theta} \in \mathcal{O}_0$ then $\lambda = 1$
	Idea: reject of I is small enagh

Lecture Notes Page 1

LRT has rejection region

$$2 = \{x \mid \lambda(x) \le c \}$$

2 some threshold

Choose c' to strike a balance between type I and II error.

Ex, let
$$\times_n \stackrel{iid}{\sim} N(0, 6^2)$$
 Known

$$H_o: \theta \leq \alpha \quad V. \quad \theta > \alpha$$

Lets form our LRT

$$\left(-\right)_{0} = \left(-\infty, a\right)$$
 and $\left(-\right)_{\alpha} = \left(a, \infty\right)$

$$L(\theta) = \prod_{N=1}^{N} \frac{1}{\sqrt{2\pi 6^2}} \exp\left(-\frac{1}{26^2} (\chi_n - \theta)^2\right)$$

$$= (2\pi t) (6^2) \exp\left(-\frac{1}{26^2} \chi_n - \theta)^2\right)$$

$$= (2\pi t) (6^2) \exp\left(-\frac{1}{26^2} \chi_n - \theta)^2\right)$$

$$So = \frac{L(\bar{X})}{L(\bar{X})} = 1$$

$$\hat{\theta}_{o} = \max_{0 \in \mathcal{C}_{o}} L(0) = \alpha$$

1. 01.00 / COT OCT

$$\lambda = \frac{L(a)}{L(\bar{x})}$$

$$\lambda = \begin{cases} 1 & \overline{x} \leq \alpha \leq \text{never reject} \\ \frac{L(\alpha)}{L(\overline{x})} & \overline{x} > \alpha \leq \text{sametimes reject} \end{cases}$$

LRT saye reject
$$H_o: \theta \leq \alpha$$
 if
$$\frac{L(\alpha)}{L(X)} \leq C \quad \text{where} \quad C \in (0, 1)$$

$$\lambda = \frac{L(a)}{L(x)} = \frac{(xt)^{-1/2}(6^2)^{-1/2}}{(2t)^{-1/2}(6^2)^{-1/2}} \exp(-\frac{1}{26^2} \frac{x}{n} (x_n - a)^2)$$

$$= \exp(-\frac{1}{26^2} \frac{x}{n} (x_n^2 - 2x_n a + a^2))$$

$$= \exp(-\frac{1}{26^2} \left[\frac{x}{n} x_n^2 - 2x_n x + x^2 \right])$$

$$= \exp(-\frac{1}{26^2} \left[\frac{x}{n} x_n^2 - 2x_n x + Na^2 \right])$$

$$= \exp(-\frac{1}{26^2} \left[\frac{x}{n} x_n^2 - 2x_n x + Nx^2 \right])$$

$$= \exp(-\frac{1}{26^2} \left[\frac{x}{n} x_n^2 - 2x_n x + Nx^2 \right])$$

$$= \exp(-\frac{1}{26^2} \left[\frac{x}{n} x_n^2 - 2x_n x + Nx^2 \right])$$

$$= \exp(-\frac{1}{26^2} \left[\frac{x}{n} x_n^2 - 2x_n x + Nx^2 \right])$$

$$= \exp(-\frac{1}{26^2} \left[\frac{x}{n} x_n^2 - 2x_n x + Nx^2 \right])$$

$$\lambda = \exp\left(-\frac{N}{2\sigma^{2}}(\overline{X} - \alpha)^{2}\right)$$
So LPT says reject when
$$\exp\left(-\frac{N}{2\sigma^{2}}(\overline{X} - \alpha)^{2}\right) \leq C$$

$$\Rightarrow -\frac{N}{2\sigma^{2}}(\overline{X} - \alpha)^{2} \leq \log C$$

$$\Rightarrow (\overline{X} - \alpha)^{2} \geq -\frac{2\sigma^{2}}{\log C}(\overline{X} - \alpha)^{2}$$

$$\Rightarrow \overline{X} - \alpha \geq \sqrt{-\frac{2\sigma^{2}}{\log C}}$$

$$\Rightarrow \overline{X} - \alpha \geq \sqrt{-\frac{2\sigma^{2}}{\log C}}$$

$$\Rightarrow \overline{X} - \alpha \geq \sqrt{-\frac{2\sigma^{2}}{\log C}}$$

$$\downarrow \overline{X} = \alpha \leq \sqrt{-\frac$$

may m

$$\max_{\Theta \in \mathcal{O}_0} \mathbb{P}_{\theta}(\text{resect}) = \alpha$$

$$P_{0}(\text{reject Ho}) = \beta(0) \qquad \times_{n} \sim N(0, \sigma^{2})$$

$$= P(\lambda \leq C) \qquad \overline{X} \sim N(0, 6^{2}N)$$

$$= P(\overline{X} - \alpha \geq C^{*}) \qquad \overline{X} \sim N(0, 1)$$

$$= P(\overline{X} - \alpha \geq C^{*}) \qquad \overline{X} \sim N(0, 1)$$

$$= P_{\theta} \left(\frac{\overline{X} - Q}{6/\overline{IN}} + \frac{Q - Q}{6/\overline{IN}} > \frac{Q + Q - Q}{6/\overline{IN}} \right)$$

$$= \mathbb{P}\left(\frac{\overline{X} - O}{O\sqrt{N}} > C^* + \frac{a - O}{O\sqrt{N}}\right)$$

$$= \mathbb{P}\left(\frac{\overline{X} - O}{O\sqrt{N}} > C^* + \frac{a - O}{O\sqrt{N}}\right)$$

Ho: $0 \le a$ V. Ha: 0 > a $0 < c + \frac{a - 0}{27}$ maximial (arge as possible possible)

i.e. 0=0

1-1019-1-

$$\rho(0) = P_0(2 > C^* + \frac{\alpha - \alpha}{6\sqrt{N}})$$

$$= P_0(2 > C^*)$$

to make a Size of fest I need to Choose C* so that

$$P(2>c*) = \propto NCG(1)$$

$$F_{z}(c^{*}) = P(z \leq c^{*}) = 1 - \alpha$$

$$c^{*} = F_{z}(F_{z}(c^{*})) = F_{z}(1 - \alpha)$$

$$\xi \chi$$
, $H_0: 0 \le 5$ $H_a: 0 > 5$
 $\chi_1 = 1$, $\chi_2 = 7$, $\chi_3 = 9$, $\chi_4 = 5$, $\chi_5 = 6$
 $N = 5$
 $S = 1.2$
 $S = 1.2$
 $S = 1.4$
 $S = 1.4$

$$\frac{\overline{X} - \alpha}{2} = \frac{6}{1.2/\sqrt{5}} = \frac{1.04}{1.05}$$

$$\frac{\overline{X} - \alpha}{6/\sqrt{N}} = \frac{6}{1.2/\sqrt{5}} = \frac{1.04}{1.05}$$

Z < C* so me dont have evidence to reject.

Defu: Uniformly Most-Powerful Tests (UMP)

Cet C be a collection of tests testing the hypothesis

Ho: OE E) v. Ha: OE (-)

A test w/ the power function $\beta^*(0) = P_0(X \in R)$ is called the uniformly most powerful
test (UMP) [for the collection C]

if

 $\beta^*(\theta) > \beta(\theta) \quad \forall \theta \in G$ in e
